ABSTRACT:

PURPOSE: To measure a wide range of scattering beam containing large angle scattering beam with high accuracy by simple constitution by measuring the scattering beam due to parallel beam applied in different directions at a plurality of angle positions through a double slit.

CONSTITUTION: A lateral scattering beam measuring optical system 3 is constituted of a laser diode 31, a collimator lens 32 converting the output beam from the laser diode to parallel beam and a lateral scattering beam sensor structure 33 provided to the plane crossing the irradiation surface to a flow cell 1 at a right angle. The structure 33 is constituted of slit plates 331, 332 each having slits S formed thereto in the same number as photodetectors 335a-335e and curved into a cylindrical shape in different radii. Since scattering beam is incident to the photodetectors 335a-335e through the double slits S, the scattering angle range of beam becomes extremely narrow and the intensity distribution of scattering beam can be measured with

high accuracy.  
The outputs of the photodetectors 335a-335e are inputted to a computer 4 along with the output of the ring detector 24 of a forward scattering/diffracted beam measuring optical system 2 and the particle size distribution of particles to be measured is calculated.

TITLE: Optical particle detector for measuring particle size distribution - has several optical sensors which detects size of irradiated material from intensity ratio of scattered light in several direction

TIX:

Optical particle detector for measuring particle size distribution - has several optical sensors which detects size of irradiated material from intensity ratio of scattered light in several direction

ABTX:

The detector includes a semiconductor laser (2) which irradiates a light to an irradiated material (1). The irradiated material scatters the irradiated light and produces an incidence angle in several directions.

ABTX:

ADVANTAGE - Reduces optical particle detector cost due to eliminated complex optical sensor. Accurately detects size of irradiated material from intensity ratio of scattering light accurately. Ensures irradiated material with improved size detection sensitivity. Prevents direct projection of irradiated light in optical detector.
